STACK

Languages

Python, Go, SQL, TypeScript

Backend

Django REST Framework,
FastAPI, Celery, Redis

Frontend

React, Redux

Databases

PostgreSQL, Oracle, PL/SQL,
ODI

Infrastructure

Docker, Nginx, Keycloak, Git

EDUCATION

Pacific National University

Computer Security ·
Khabarovsk, Russia

LANGUAGES

Russian native

English B2

AVAILABILITY

Remote only. Full-time, part-time or project-based.

PROFILE

Backend developer working in **Python**, with **Go** as a second language. I build services end to end: data schema, API, background jobs, frontend, deployment. For three years I have been building internal products on top of a corporate Oracle warehouse, so legacy schemas and awkward data volumes are familiar ground. I like problems where the solution has to be justified with data instead of picked out of habit.

EXPERIENCE

Python Developer

August 2023 – present

MegaFon · telecom · remote

Internal web services for analysts and the on-call data team: a data quality portal built on Django REST + React, and a data mart readiness forecasting subsystem. The portal replaced manual checks over SQL and email with a single interface featuring automated metric matching and email reports. Source of record — a corporate Oracle data warehouse.

- **Portal backend on Django REST Framework:** service layer, dataclass DTOs at layer boundaries, domain exceptions with a single mapping to HTTP statuses, access control by Active Directory groups, SSO via Keycloak.
- **React + Redux SPA:** checks, KPIs, aggregates, readiness forecast. I own the feature end to end, backend and frontend alike.
- **Readiness forecasting service.** Nightly collection of scheduler history into PostgreSQL via Celery, a quantile model accounting for calendar patterns and job dependencies, refined intraday. Backtested at **MAE 26 minutes against 90** for the naive estimate, p90 coverage $\approx 89\%$.
- **KPI catalogue ingestion from CSV** with fuzzy record matching and automatic classification into created, updated and closed metrics. Replaced manual file reconciliation by analysts.
- **Django ORM over a legacy Oracle schema:** multiple database aliases, read-only models on top of existing tables.
- **Production ETL incidents** (Oracle, ODI, PL/SQL) investigated to root cause: character-set issues, NLS settings, SCD Type 2 duplicates, hung sessions.
- Ran a code review of the codebase with prioritised findings and a remediation plan.

SIDE PROJECT

open-lumen — an end-to-end encrypted messenger. Go backend, React and TypeScript on the front. github.com/kultvio
